

Case Study: Protection for New Facilities

Customer

National Retailer Distribution Center

Situation

When building a new distribution facility there are many things to consider. One of those is how to best protect costly equipment within the facility. The distributor knew that the costly investment of new conveyor systems and forklift charging stations would need to be protected. One impact from a forklift could cost not only thousands of dollars in damage, but also loss of productivity.

Solution

Having seen Impact Recovery's SlowStop® bollards at work in other facilities, and liking the clean look and superior protection, they decided to install SlowStop throughout their new facility. Using a combination of different sized bollards and guardrails, they were able to completely customize the level of protection needed at each location throughout the facility. They are incredibly pleased with the uniform look and unrivaled protection of using Impact Recovery's SlowStop products throughout their new facility.
